B. Stability in Water

Test Substance

Identity: 2-Chloropyridine

Remarks: None

The computer modeling program can not estimate the rate constants for aqueous acid/base-catalyzed hydrolysis. Although hydrolysis cannot be predicted using a computer estimation model, 2-chloropyridine does not have a site in which the water molecule or hydroxide ion can displace an atom or group of atoms. Chemical hydrolysis at a pH normally found in the environment, i.e. 5 to 9, can be important for a variety of chemicals that have functional groups that are potentially hydrolysable, such as amides, carbamates, carboxylic acid esters and lactones, epoxides, phosphate esters, and sulfonic acid esters. It is the position of Arch Chemicals that data for this endpoint is not necessary since this chemical does not possess a structure that is hydrolysable. The judgment is that 2-PCl would be resistant to acid/base-catalyzed hydrolysis.

C. Biodegradation – Entry 1 of 5

Test Substance

Identity: 2-Chloropyridine

Purity: > 96%

Remarks: Purchased from Sigma Chemical Co. St. Louis, MO

Method

Method: Non-specific test method for substrate depletion and

methane formation in a sealed system.

Test type: Anaerobic biodegradation in a sediment/water

slurry.

GLP: Not stated Year: 1994 Contact time: 12 months

Inoculum: Sediment and ground water collected from a

methanogenic aquifer contaminated with landfull

leachate.

Remarks: Experiments were performed in triplicate and

employed both sterile and substrate-unamended controls. In addition acetate and 3-chlorobenzene were employed as positive controls. The headspace

of the test vessels was monitored for methane formation by gas chromatography (GC). Methane produced in unamended controls was subtracted from that produced in substrate-amended vessels and compared to the theoretically expected amount

based on Buswell's equation and the initial

substrate concentration. Substrate depletion and metabolite formation was monitored by reversephase high-pressure liquid chromatography

(HPLC).

Results

Degradation: 2-Chloropyridine was not removed from the test

system and evidence of mineralization was not

observed.

Results: No methane production was observed. Substrate

recovery after 1 year of incubation was 107±5%.

No intermediates were observed.

Kinetic: Not stated Breakdown products: Not stated Remarks: None

Conclusions The biodegradability of the test sub stance has been

adequately characterized.

Data Quality

Reliability: 2A

Remarks: Reliable with restrictions; acceptable, well-

documented publication/study report which meets

basic scientific principles.

Reference Adrian, N. R. and Sulfita, J. M. 1994. Anaerobic

biodegradation of halogenated and nonhalogenated N-, S- and O-heterocyclic compounds in aquifer slurries. Environ. Toxicol. Chem. 13, 1551-1557.

Entry 2 of 5 for Biodegradation

Test Substance

Identity: 2-Chloropyridine

Purity: Not stated

Remarks: Purchased from Sigma Chemical Co. St. Louis, MO

Method

Method: Non-specific test method for substrate depletion.

Test type: Anaerobic GLP: Not stated Year: 1995
Contact time: 12 months

Inoculum: Sediment and ground water collected from a

freshwater pond contaminated with small particles

of asphalt.

Remarks: Experiments were performed in duplicate and

employed both sterile and substrate-unamended controls. Substrate depletion and metabolite

formation was monitored by HPLC.

Results

Degradation: 2-Chloropyridine was not removed from the test

system.

Results: Some loss of 2-chloropyridine was observed;

however, the loss was not significantly different from that in the corresponding sterile controls. No

transformation was observed.

Kinetic: Not stated Breakdown products: Not stated Remarks: None

Conclusions The biodegradability of the test sub stance has been

adequately characterized.

chlorinated pyridines in anoxic freshwater sediment slurries. J. Environ. Sci. Health. A30, 485-503.

Entry 3 of 5 for Biodegradation

Test Substance

Identity: 2-Chloropyridine Purity: Not stated

Remarks: Purchased from Aldrich Chemical Co.

Method

Method: Assessment of degradation based on substrate

depletion.

Test type: Anaerobic biodegradation

GLP: Not stated Year: 1989 Contact time: 200 days

Inoculum: Sediment and overlying site water from an estuary. Remarks: Biodegradation of 2-chloropyridine was evaluated

in sediment slurries (10% solids) under sulfate reducing conditions. Experiments were replicated and included control sediments. Testing was conducted at 78.8 μ M. Test chambers were incubated in the dark at 23-25°C. Samples for analysis were removed using a syringe and needle periodically. Substrate concentration was measured

using HPLC.

Results

Degradation: None reported

Results: 2-Chloropyridine was persistent in the anoxic

sediment.

Kinetic: Not stated Breakdown products: Not stated Remarks: None

Conclusions The biodegradability of the test sub stance has been

adequately characterized.

Data Quality

Reliability: 2B

Remarks: Reliable with restrictions; basis data given,

comparable to guidelines/standards.

Toxicity and anaerobic biodegradability of pyridine and its derivatives under sulfidogenic conditions.

Chemosphere 10, 2345-2357.

Entry 4 of 5 for Biodegradation

Test Substance

Identity: 2-Chloropyridine
Purity: Not stated
Remarks: None

Method

Method: Non-guideline specific study of biodegradation of

the test substance in soil suspensions.

Test type: Aerobic biodegradability

GLP: No Year: 1986 Contact time: 24 days

Inoculum: Soil suspension

Remarks: Degradation experiments were carried out in 500-ml

Erlenmeyer flasks. Flasks were prepared to contain 150 ml of basas salts medium amended with yeast extract and potassium phosphate buffer adjusted to pH 7.0. To each replicate flask (note – replication noted in article, but the number of replicates was not specified) 1 ml of 2-chloropyridine solution was added to give a final substrate concentration of approximately 1 mM. Flasks were inoculated with

1 ml of a dilute soil suspension prepared by suspending 15 g soil (Fincastle silt loam) in 1 l of mineral salts medium and continuously stirring while 1-ml aliquots were removed. Flasks were incubated at 24°C for up to 30 days. Subsamples were removed from each flask before and after inoculation and periodically throughout the

incubation. 2-Chloropyridine concentrations were

monitored by UV spectrophotometry during the incubation period. The disappearance of 2-

chloropyridine from solutions plus the mineralization of pyridine-N was taken as evidence

of degradation.

Results

Degradation: UV analysis indicated a 47% loss of 2-

chloropyridine from the test solutions by 24 days, while inorganic nitrogen released to the test solutions accounted for <1% degradation.

Results: 2-Chloropyridine did not appear to be appreciable

degraded. The amount of 2-chloropyridine lost

from the test solutions determined by UV analysis was 47% within 24 days. Less than 1% was determined to be biodegraded based on release of inorganic nitrogen in the test solutions, while 37% was lost through volatilization and 3.2% adsorbed

by soil.
Kinetic: Not stated
Breakdown products: Not stated
Remarks: None

Conclusions The biodegradability of the test sub stance has been

adequately characterized.

Data Quality

Reliability: 2A

Remarks: Reliable with restrictions; acceptable, well-

documented publication/study report which meets

basic scientific principles.

Reference Sims, G. K. and Sommers, L. E. 1986.

Biodegradation of pyridine derivatives in soil

suspensions. Environ. Toxicol. Chem. 3, 503-509.

Entry 5 of 5 for Biodegradation

Test Substance

Identity: 2-Chloropyridine
Purity: Not stated
Remarks: None

Method

Method: Non-specific method measuring substance depletion

and inorganic N released.

Test type: Aerobic biodegradation in soil

GLP: Not stated Year: 1985
Contact time: 64 days

Inoculum: The test soil was a Fincast silt loam which had a pH

of 6.7, organic carbon content of 12 g/kg, total N content of 1300 mg/kg, CEC of 0.15 mol (+)/kg and contained 0.25 kg H_2O/kg dry soil as - 0.03 MPa.

Remarks: Test chambers were prepared in duplicate and dosed

at 200 mmol/kg. At 3- and 4-day intervals the soils were adjusted for loss of moisture. After 0, 1, 2, 4, 8, 16, 32 and 64 days of incubation, the foam stoppers and soil from rjeplicate chambers were extracted and analyzed. In addition, a sterile

treatment was extracted and analyzed after 7 days of

incubation.

Results

Degradation: 89% of the test substance remained in the soil after

64 days of incubation, indicating little

biodegradation of the test substance occurred over the study period. This was confirmed by little inorganic nitrogen accumulation during incubation.

Results: The measured day 0 concentration of the test

substance was 113.7% of the nominal

concentration. After 64 days of incubation, 89% of

the test substance remained in the soil.

Accumulation of inorganic nitrogen at days 16, 32 and 64 was equivalent to 1.3, < 0.1 and <0.1% of

the extratable test substance.

Kinetic: Not stated Breakdown products: Not stated Remarks: None

Conclusions The biodegradability of the test sub stance has been

adequately characterized.

Data Quality:

Reliability: 2A

Remarks: Reliable with restrictions; acceptable, well-

documented publication/study report which meets

basic scientific principles.

A. Acute Toxicity to Fish

Test Substance

Identity: 3-Methylpyridine (CAS RN 108-99-6)

Purity: Not stated Remarks: None

Method

Method: OECD Guideline 203 Test type: Acute, static renewal

GLP: Yes Year: 1991

Species/Strain/

Supplier: Zebra fish (*Brachydanio rerio*)/Not stated/Local

fish hatchery

Analytical monitoring:No

Exposure period: 96 hours Statistical methods: None

Remarks: The study measured the acute toxicity of the test

substance to Zebra fish during a 96-hour staticrenewal exposure period. Fish in holding tanks were fed a commercial fish food. Fish were acclimated to the water used in the test for 12 days prior to testing. Mean body weight and mean length of 30 fish used in testing were 0.42 g and 3.3 cm, respectively. Dilution water was reconstituted water made according to EEC directive. Dilution water characteristics were within the EEC directives for pH (7.9 \pm 0.3), dissolved oxygen (\geq 74 % saturation at 20 °C) and hardness (250 \pm 50 mg/l as CaCO₃). Test vessels were 8.3-1 all-glass aquarium filled with 5 l of dilution water. They were fitted with aeration tubes, covered with a glass pane during the test and held in a water-bath at 22 ± 2 °C under a 16 hour light/8 hour dark photoperiod. Solutions of the substance were prepared by adding an aliquot of a 10 g test substance/l of stock solution to each test chamber. Test solutions were prepared fresh each day of the test. The pH, dissolved oxygen concentration and temperature of the test media were measured at the beginning and the end of the test. Fish were inspected at the beginning of

the test and after approximately 2, 4, 24, 48, 72 and 96 hours for lethality and any behavior different

from the control group.

Results

Nominal

concentrations:

0, 100, 180, 320, 560 and 1000 mg/l

Measured

Not measured concentrations:

LC₅₀ (96 hours): Remarks:

Greater than 560 but less than 1000 mg/lThe 96-hour NOEC with respect to behavior was

320 mg/l and the 96-hour NOEC with respect to

mortality was 560 mg/l.

Conclusion The acute toxicity of the test substance has been

adequately characterized.

Data Quality

Reliability: 1A

Remarks: Reliable without restriction; OECD guideline study

Acute Toxicity to Daphnids

Test Substance

Identity: 3-Methylpyridine (CAS RN 108-99-6)

Purity: Not stated Remarks: None

Method

Method: OECD Guideline 202

Test type: Acute static

GLP: Yes Year: 1991

Species/Strain/

Supplier: Daphnia magna Straus/Not stated/State University

of Ghent

Analytical monitoring:No

Exposure period: 48 hours

Statistical methods: No statistics applied to data

Remarks: Dilution water was reconstituted water prepared

according to ISO-6341, 1982, with micronutrients. The pH was 7.7 ± 0.1 , the water was oxygensaturated and the hardness was 250 ± 25 mg/l as CaCO₃. Daphnids were < 24 hours old at the start of the test. Test vessels were 80-ml all glass tubes containing 50 ml of test solution. Test solutions were prepared by adding an aliquot of a stock solution (1.0077 g 3-methylpyridine/l) to the dilution water. Four replicate test tubes were used

per concentration and each test tube held 5

daphnids. The pH, dissolved oxygen concentration and temperature of the test medium in each test tube were measured at the start and end of the test. At 24 and 48 hours of the test, daphnids were evaluated for immobility. Daphnids not able to swim within 15 seconds after gentle agitation of the test tube

were considered immobile.

Results

Nominal

concentrations: 0, 100, 180, 320, 560 and 1000 mg/l

Measured

concentrations: Not measured EC₅₀ (48 hour): 320 mg/l NOEC: 180 mg/l

Conclusions The 48-hour acute toxicity of the test substance to

Daphnia magna has been adequately characterized.

Acute Toxicity to Aquatic Plants (Algae)

Test Substance

Identity: 3-Methylpyridine (CAS RN 108-99-6)

Purity: Not stated Remarks: None

Method

Method: OECD Guideline 201

Test type: Acute static growth inhibition

GLP: Yes Year: 1991

Species/Strain/

Supplier: Selenastrum capricornutum/CCAP 278-4/CCAP,

UK

Analytical monitoring:No

Exposure period: 72 hours

Statistical methods: No statistics applied to data

Remarks: The growth medium used in the test was prepared

according to the OECD guideline. The medium was filter-sterilized with a 0.45 µm membrane filter. The algae were cultured at the testing facility for several weeks in Boltz Basal Medium (BBM). Test vessels were all-glass 100-ml Erlenmeyer flasks containing 50 ml of test solution. Triplicate flasks were used at each test concentration. Test solutions were prepared by adding an aliquot from each of five stock solutions (1, 3.2, 10, 32 and 100 g test substance/l) to the appropriate test flasks. Flasks were inoculated with algal cells to achieve an initial cell density of 10⁴ cells/ml. Flasks were incubated n an environmental cabinet under continuous illumination at a temperature of 25 ± 1 °C. Flasks

illumination at a temperature of 25 ± 1 °C. Flasks were continuously shaken during the experiment. Cell counts were made after 3 days of incubation using a Neubauer counting chamber. The average specific growth rate was calculated for each flask and the average growth rate for each treatment was compared to the control group. The pH of the test solutions was measured in each flask at the

beginning and end of the test.

Results

Nominal

concentrations: 0, 10, 32, 100, 320 and 1000 mg/l

Measured

concentrations: Not measured EC_{50} (72-hour): 320 mg/l

Conclusions The 72-hour acute toxicity of the test substance to

Selenastrum capricornutum has been adequately

characterized.

Species/Strain: Rat/Manor Wistar

Sex: Male

Number of animals/

sex/dose: 6

Vehicle: Methylcellulose

Route of

administration: Oral (gavage)

Remarks: Groups of 6 male rats were administered a single

dose of the test substance suspended in a 0.5% aqueous dispersion of methylcellulose via oral gavage at concentrations of 100, 215, 464, 681, 1000, 1470 and 2150 mg/kg. Each dose level was

prepared in a concentration that enabled the delivery of a constant volume of 1.0 ml/100 g of body weight. Rats were in the weight range of 201-304 g. Food was withheld from all ras for 16 hours prior to dosing. Food and water were available *ad libitum* at all other times. Rats were observed for signs of toxicity and mortality continuously for 4 hours post-dose, at 24 hours post dose and once daily thereafter for 13 days. At the termination of the 14-day observation period, surviving rats were sacrificed. Necropsies were performed on all rats.

Results

Value: $LD_{50} - 342 \text{ mg/kg}$ (confidence limits -211 - 558

mg/kg)

Mortality rate: Dose (mg/kg) Mortality
100 0/6
215 1/6

1470	6/6
2150	6/6

Remarks:

At 16 hours post-dose, 4 rats in the 100 mg/kg dose group exhibited nasal porphyrin. At 24 hours postdose, 4 rats appeared hypoactive. All animals appeared normal thereafter until study termination. Two rats in the 215 mg/kg dose group exhibited nasal porphyrin discharge at 4 hours post-dose. At 24 hours post-dose 4 rats were ataxic, sedate, hypoactive and displayed nasal porphyrin discharge. At 2 days all rats were hypoactive and continued to demonstrate nasal discharge. One animal was found dead on day 3. The remaining rats appeared normal throughout the remainder of the observation period. Within 6 hours 5 rats from the 464 mg/kg dose group exhibited ataxia and hypoactivity. One rat became prostrate. At 24 hours all rats were ataxic and exhibited nasal porphyrin. One rat was prostrate and dyspneic. At 2 days 1 rat died and 2 were ataxic and the remaining 3 appeared hypoactive. At 3 days all 5 rats were hypoactive and appeared depressed. At 4 days one died and the remaining 4 continued to be hypoactive and became hypersensitive to touch. Two more rats died on days 5 and 6. The remaining 2 rats were hypoactive and hypersensitive to touch. A fifth rat died. The remaining rat recovered and appeared normal from days 9 through 14. Rats in the 681, 1000, 1470 and 2150 mg/kg dose groups displayed hypotonia, ataxia, sedation, hypnosis, loss of righting reflex, pinna and placing reflexes, bradypnea, dyspnea, cyanosis, ptosis, salivation and reduced pain responses within 2 to 18 hours post-dose. Rats in all dose groups except the 681 mg/kg dose group died within 2 to 4 hours post-dose. Rats in the 681 mg/kg dose group died within 3 days. At necropsy, 1 rat in the 100 mg/kg dose group had hydronephrosis. The rat that died in the 215 mg/kg dose group exhibited a pale liver with friable accentuated lobules and the lungs were congested. Necropsy findings in the rats that died in the 464 mg/kg dose group included congested lungs, congested liver, hemorrhages of the stomach, small intestines and urinary bladder and icterus. All rats in the 100, 215 andf 464 mg/kg dose groups that

survived to the 14-day post-exposure period had essentially normal necropsy findings. Necropsy findings in the 681, 1000, 1470 and 2150 mg/kg

dose groups included scrotal erythema,

hemorrhages of the stomach, intestines and urinary

bladder and congested lungs and liver.

Hydronephrosis (unilateral and bilateral) was

scattered in all groups.

Conclusions

Remarks: The acute oral LD_{50} has been adequately

characterized.

Data Quality

Reliability: 1B

Remarks: Reliable without restriction; comparable to

guideline study.

Acute Toxicity – Entry 2 of 5

Test Substance

Identity: 2-Chloropyridine

Purity: > 97% Remarks: None

Method

Method: "Sleeve" technique described by Draize et al.

(1944) and Rowe et al. (1952). These references

are cited in the study reference.

Type: LD_{50} GLP: No Year: 1966 Species/Strain: Rabbit

Sex: Male and female

Number of animals/

dose: 4-5 Vehicle: None

Route of

administration: Dermal

Remarks: Groups of male and female rabbits, weighing 1.3 to

2.3 kg, were exposed to the undiluted test substance dermally at concentrations of 40, 48, 50, 58, 63, 68,

79, 82 or 100 mg/kg.

Results

Value: $LD_{50} - 64 \text{ mg/kg}$ (confidence limits -55.5 to 73.5

mg/kg)

Mortality rate:	Dose (mg/kg)	Mortality
-	40	0/5
	48	1/4
	50	1/5
	58	2/5
	63	3/4
	68	2/5
	79	3/4
	82	3/5
	100	5/5

Remarks: The test substance caused only transient local

congestion of the skin when applied to either intact or abraded skin. The primary gross lesion observed

was hemorrhagic necrosis of the liver.

Conclusions

Remarks: The acute dermal LD₅₀ has been adequately

characterized.

Data Quality

Reliability: 2A

Remarks: Reliable with restriction; acceptable, well-

documented publication which meets basic

scientific principles.

A Comparison of the Lethality of Chlorinated Pyridines and a Study of the Acute Toxicity of 2-Chloropyridine. Toxicol. Appl. Pharmacol. 11, 361-

371.

Acute Toxicity – Entry 3 of 5

Test Substance

Identity: 2-Chloropyridine Purity: Not determined

Remarks: None

Method

Method: Not stated

Type: Acute dermal toxicity

GLP: No Year: 1964 Species/Strain: Rabbit

Sex: Male and female

Number of animals/

sex/dose: 3 Vehicle: None

Route of

administration: Dermal

Remarks: Six rabbits (3 M; 3 F) per group, weighing between

2040 and 2828 g, were administered a single dose

of the undiluted test substance dermally at

concentrations of 200 and 2000 mg/kg. The back of each rabbit was clipped. The clipped back of 3 rabbits per group was abraded and the skin of the remaining 3 rabbits was left intact. The rabbits were exposed to the test substance for a period of 24 hours. The dosing site was not occluded during the 24 hour exposure period. Rabbits were observed frequently for pharmacotoxic effects during the first 4 hours after application, at 24 hours and once daily thereafter for a total of 14 days. The degree of dermal irritation and damage was evaluated. At the end of the observation period all surviving rabbits were weighed, sacrificed and necropsied. Rabbits that did not survive the observation period also were

necropsied.

Results

Value: $LD_{50} - < 200 \text{ mg/kg}$ Mortality rate: 200 mg/kg - 5/6

2000 mg/kg - 6/6

Remarks: Five rabbits in the 200 mg/kg dose group died

within 18 to 40 hours post-dose. Death was preceded by cyanosis, bradypnea and dyspnea,

lacrimation, hypothermia and hypotonia of the sleletal musculature. One rabbit with intact skin survived. This rabbit demonstrated a very slight erythema of the area of application for the entire observation period. All rabbits in the 2000 mg/kg dose group died within 18 hours after displaying signs as noted above. Necropsy findings in the 200 mg/kg dose group included excessive mucous in the stomach and lungs that failed to collapse and which were congested and hemorrhagic. Fluid was found in the thoracic cavity and a strong odor of the test substance was present in the thoracic cavity. One rabbit displayed a hemorrhagic cecum. The surviving rabbit in this group exhibited no gross lesions. Necropsy findings in the 2000 mg/kg dose group included excessive mucous in the stomach and lungs that failed to collapse and which were congested and hemorrhagic. Foam was present in the trachea and major bronchi. A strong test substance odor was present in the thoracic cavity of all rabbits.

Conclusions

Remarks: The acute dermal toxicity has been adequately

characterized.

Data Quality

Reliability: 1B

Remarks: Reliable without restriction; comparable to

guideline study.

Acute Toxicity – Entry 4 of 5

Test Substance

Identity: 2-Chloropyridine

> 97% Purity: Remarks: None

Method

Method: Not stated

Type: Acute inhalation toxicity

GLP: No Year: 1966 Species/Strain: Rat Sex: Female

Number of animals/

dose: 10 - 20Vehicle: None

Route of

administration: Inhalation

Remarks: Groups of female rats, approximately 10 weeks old

and weighing 132 to 190 g, were exposed to the test substance via inhalation at concentrations of 50, 100, 250, 500 and 1000 ppm for 0.1 to 7.0 hours.

The concentration of 2-chloropyridine was monitored continuously during the exposure by infrared spectrophotometry. The degree and character of organic damage resulting from

exposure to the test substance were the presence of

gross pathologic or histopathologic lesions,

hematologic alterations, organ weight changes and changes in the blood chemistry. Liver, kidney, spleen, heart, lungs and brain were examined for weight changes and together with pancreas and adrenals for the presence of histologic lesions. Hematologic studies consisted of erythrocyte, leukocyte and differential counts and hematocrit and hemoglobin determinations. Parameters used to detect changes in blood chemistry were blood urea nitrogen, serum glutamic-pyruvic transaminase and serum glutamic-oxalacetic transaminase. Rats were

observed for 2 weeks post-exposure.

Results

Value: $LC_{50} -> 100 \text{ ppm but} < 250 \text{ ppm}$

Mortality rate:	Dose Level (ppm)	Length of Exposure (hrs)	Mortality Rate
	50	7.0	0/10
		4.0	0/10
	100	7.0	13/20
		4.0	7/20
		2.0	0/10
	250	7.0	12/12
		4.0	14/20
		2.0	8/10
		1.0	2/10
		0.5	0/10
	500	2.0	15/15
		1.0	8/15
		0.5	2/15
		0.2	0/14
	1000	1.0	14/15
		0.5	8/10
		0.2	8/17
		0.1	0/20

Remarks:

The concentration of 2-chloropyridine vapor was within 7% of the desired concentration throughout the exposure period. Liver damage was the primary alteration caused by the inhalation of the test article. Histopathologic examinations revealed that the test substance caused central lobular necrosis, hemorrhage and fatty degeneration as well as cellular infiltration. The extent and type of damage varied with the exposure. Maximum single-dose exposures not causing these changes were 100 ppm for 3 minutes, 50 ppm for 6 minutes, 25 ppm for 12 minutes and 10 ppm for 30 minutes. Maximum single-dose exposures that did not cause death 1000 ppm for 6 minutes, 500 ppm for 12 minutes, 250 ppm for 30 minutes, 100 ppm for 2 hours and 50 ppm for 4 hours.

Conclusions

Remarks:

The LC_{50} was not calculated, but based on the available data, the 4-hour LC_{50} is between 100 and

250 ppm. Therefore, the acute inhalation LC_{50} has

been adequately characterized.

Data Quality

Reliability: 2A

Remarks: Reliable with restriction; acceptable, well-

documented publication which meets basic

scientific principles.

A Comparison of the Lethality of Chlorinated Pyridines and a Study of the Acute Toxicity of 2-Chloropyridine. Toxicol. Appl. Pharmacol. 11, 361-

371.

Acute Toxicity – Entry 5 of 5

Test Substance

Identity: 2-Chloropyridine Purity: Not determined

Remarks: None

Method

Method: Not stated

Type: Acute inhalation toxicity

GLP: No Year: 1964 Species/Strain: Rat Sex: Male

Number of animals/

sex/dose: 10 Vehicle: None

Route of

administration: Inhalation

Remarks: Ten male albino rats, weighing 235 to 270 g, were

exposed to the test substance via inhalation at a concentration of approximately 6.05 mg/l for 6 hours. The exposure was conducted in a 354 l stainless steel chamber. The total airflow through the system was 49±1 liters/minute. Food and water were available *ad libitum*, except during the period of exposure. During exposure, rats were observed for signs of toxicity and mortality continuously for 1 hour and at 1/2 hour intervals thereafter until the end of the exposure period. After the exposure period, the rats were observed daily for 14 days. A

necropsy was performed on all rats.

Results

Value: $LC_{50} - < 6.05 \text{ mg/l}$

Mortality rate: 10/10

Remarks: All animals died within 3 days after exposure.

Observations during exposure included

hypoactivity, sedation and ataxia. At the end of 4 hours of exposure, all rats were prostrate. Three rats exhibited dyspnea. Three rats died between 4 and 6 hours of the exposure period. At the end of 6 hours the surviving rats were prostrate, comatose and dyspneic. Within 24 hours, 2 additional rats died. The remaining 5 rats were still prostrate and comatose. Clear ocular discharge was noted.

Within the following 24-hour period after exposure, 4 more rats died. The tenth rat died at 3 days post exposure. Necropsy findings in all rats included congestion of the lungs and liver, slight congestion of the small intestines, blood in the abdominal cavity and /or severe hemorrhages of the stomach, small intestines and urinary bladder.

Conclusions

Remarks: The acute inhalation toxicity has been partially

characterized. These data support the data of

Gehring et al. (1967).

Data Quality

Reliability: 1B

Remarks: Reliable without restriction; comparable to

guideline study.

B. Genetic Toxicity In Vitro – Entry 1 of 3

Test Substance

Identity: 2-Chloropyridine

Purity: 99% Remarks: None

Method

Method: Ames/Salmonella Bacterial Point Mutation Assay

Type: Reverse mutation assay

Test system: Bacteria
GLP: Not stated
Year: 1987

Species/Strain: Salmonella typhimurium/TA97, TA98, TA100 and

TA102

Metabolic activation: 9000 g (S9) liver homogenate from Arochlor 1254-

induced male Sprague-Dawley rats.

Concentrations

tested: 50, 100, 500, 1000 and 5000 µg/plate without S9

50, 100, 500, 1000, 5000 and 7500 µg/plate with S9

Statistical methods: Stead et al. (1981) and Bernstein et al. (1982) from

the reference list in the cited study.

Remarks: The test procedures were the same as initially

described by Ames et al. (1975) (in reference list of cited study). All assays were conducted in the standard plate incorporation assay on at least 2 separate days both with and without metabolic activation. The test substance was tested at 6 concentrations in duplicate. Appropriate negative (solvent) and positive controls were run in parallel with the assay. The test substance and solvent control were dissolved in dimethyl sulfoxide (DMSO). The test substance was not designated positive or negative unless reproducible results were

obtained. A positive response was defined as a reproducible, concentration-related increase in histidine independent revertants over the solvent control concentration in at least one strain/activation combination. A definitive positive or negative result was assigned to a test result when the statistical methods and visual examination of the data agreed. An equivocal response occurred when 1) test results were not reproducible, 2) a low-level, but not concentration-related, increase in *his*+

colonies was obtained or 3) when an increase was

observed at only 1 concentration level.

Results

Result: 2-Chloropyridine elicited a mutagenic response in

all 4 *Salmonella* strains in the presence of the metabolic activation system only. No toxicity was

observed at any concentration.

Cytotoxic

Concentration: None

Genotoxic effects: Negative without metabolic activation. Positive

with metabolic activation in all tester strains.

Statistical results: Not stated Remarks: None

Conclusions

Remarks: This endpoint has been adequately characterized.

Data Quality

Reliability: 1B

Remarks: Reliable without restriction; comparable to

guideline study.

Comparative mutagenicity of halogenated pyridines in the *Salmonella typhimurium*/mammalian microsome test. Mutat. Res. 176, 185-198.

Genetic Toxicity In Vitro- Entry 2 of 3

Test Substance

Identity: 2-Chloropyridine
Purity: Not stated
Remarks: None

Method

Method: Not stated

Type: Mammalian cell forward mutation assay

Test system: Mammalian cells
GLP: Not stated
Year: 1992

Cell type: Heterozygous L5178Y TK^{+/-} -3.7.2C mouse

lymphoma cells.

Metabolic activation: S9 homogenate derived from livers of Arochlor-

induced rats.

Concentrations

tested: Ranging from 1200-2004 µg/ml without S9

activation.

Ranging from 400-1100 µg/ml with S9 activation

Statistical methods: Not stated

Remarks: Duplicate cultures of L5178/TK^{+/-} -3.7.2C cells

were treated with or without metabolic activation for 4 hours according to the procedures described by Turner et al. (1984)(in reference list of cited study). The mutagenicity assay was performed according to the procedures described by Doerr et al. (1989) (in reference list of cited study). A positive response was defined as one in which the induced mutant frequency was >70x10⁻⁶, at concentrations yielding >10% relative total growth.

Equivocal responses were those that gave approximately equal evidence of positive and negative responses. The positive control

compounds were ethyl methanesulfonate (without

S9) and benzo[a]pyrene (with S9).

Results

Result: In the absence of metabolic activation,

2-chloropyridine induced small increases in the mutant frequencies. In the presence of the metabolic activation system, the test substance greatly increased the frequency of gene mutations.

The test substance induced both small and large

colony tk mutants.

Cytotoxic

Concentration: None
Genotoxic effects: Positive
Statistical results: Not stated

Remarks: An analysis of the relative small and large colony tk

mutant frequencies was not performed because the induced response was not sufficient to allow interpretation of the data. Colony sizing was performed on the positive control cultures. Colony

sizing analysis for the positive controls

demonstrated the ability to recover and quantitate

both classes of tk mutants.

Conclusions

Remarks: This endpoint has been adequately characterized.

Data Quality

Reliability: 2A

Remarks: Reliable with restriction; acceptable, well-

documented publication which meets basic

scientific principles.
